

The Future is Now.

The past's future predictions for the 2020s

"I shall not be surprised if on my 92nd birthday, I am able to go for a ride in an antigravity car," mathematician and scientist D.G. Brennan wrote in 1968. Due to how fast the technology was advancing at the time, this was a common belief.

In the 1920s, many people believed glass houses would be created using a special glass that emits ultra-violet waves to provide good weather year-round.

During the 1960s and 1970s, many architects believed that "dome cities" would be created to control the weather.
